

AMENDMENTS TO THE CLAIMS:

This listing of claims will replace all prior versions and listings of claims in the application:

1. (Currently Amended) A method of georeferencing a raster map, comprising:
 - displaying a first map in one area of a display, said first map being a digital raster map;
 - displaying a second map in a second area of the display, the second map being a georeferenced map that displays at least a portion of an identical geographic region displayed in the raster map;
 - receiving a first point on the first map;
 - receiving a corresponding first point on the second map;
 - receiving a second point on the first map;
 - receiving a corresponding second point on the second map;
 - receiving pixel coordinates for the first point on the first map and the second point on the first map;
 - receiving geographic coordinates for the first point on the second map and the second point on the second map; and
 - computing a georeferencing function ~~for the first map in accordance with that~~ specifies a relationship between the pixel coordinates of the first map and the geographic coordinates of the second map.

2. (Previously Presented) The method of claim 1 further comprising receiving a verification that a point on the first map correctly matches geographically with a corresponding point on the second map.

3. (Previously Presented) The method of claim 1 wherein the first map is a portion of the second map.

4. (Previously Presented) The method of claim 1 further comprising assigning a longitude and latitude for at least one of the first point and the second point on the first map based upon the geographic coordinates read for at least one of the first point and the second point on the second map.

5. (Previously Presented) The method of claim 1 wherein at least one of the first point and the second point on the first map has a known longitude and latitude.

6. (Previously Presented) The method of claim 1 further comprising assigning geographic coordinates to an additional point received on the first map using the computed georeferencing function.

7. (Canceled)

8. (Previously Presented) The method of claim 1 further comprising receiving an additional point on the first map and automatically marking a corresponding

additional point on the second map as calculated by the computed georeferencing function.

9. (Previously Presented) The method of claim 8 further comprising receiving a correction of the additional point marked on the second map.

10. (Previously Presented) The method of claim 1 wherein an approximate georeferencing function is predefined.

11. (Currently Amended) A computer readable medium containing instructions executable by a computer to perform a method for georeferencing a raster map, the method comprising:

displaying a first map in one area of a display, said first map being a digital raster map;

displaying a second map in a second area of the display, the second map being a georeferenced map that displays at least a portion of an identical geographic region displayed in the raster map;

receiving a first point on the first map;

receiving a corresponding first point on the second map;

receiving a second point on the first map;

receiving a corresponding second point on the second map;

receiving pixel coordinates for the first point on the first map and the second point on the first map;

receiving geographic coordinates for the first point on the second map and the second point on the second map; and

computing a georeferencing function ~~for the first map in accordance with that~~ specifies a relationship between the pixel coordinates of the first map and the geographic coordinates of the second map.

12. (Previously Presented) The computer readable medium of claim 11 wherein the contents of the computer readable medium are also capable of verifying that a point on the first map correctly matches geographically with a corresponding point on the second map.

13. (Canceled)

14. (Previously Presented) The computer readable medium of claim 11, wherein the contents of the computer readable medium are also capable of receiving an additional point on the first map and automatically marking a corresponding additional point on the second map as calculated by the computed georeferencing function.

15. (Previously Presented) The computer readable medium of claim 11, wherein the contents of the computer readable medium are also capable of assigning a longitude and latitude for at least one of the first point and the second point on the second map.

16 -20. (Canceled)

21. (Currently Amended) The method of claim 1, the method further comprising:
receiving an additional point on the first map;
receiving a corresponding additional point on the second map;
receiving geographic coordinates for the additional point on the second map; and
recomputing the georeferencing function ~~for the first map~~.

22. (Previously Presented) The computer readable medium of claim 11 wherein the contents of the computer-readable medium are also capable of assigning geographic coordinates for an additional point received on the first map using the computed georeferencing function.

23. (Canceled)

24. (Previously Presented) The method of claim 1 further comprising receiving an additional point on the second map and automatically marking a corresponding additional point on the first map as calculated by the computed georeferencing function.

25. (Currently Amended) A method of georeferencing a raster map, comprising:

displaying a first map in one area of a display, the first map being a digital raster map;

displaying a second map in a second area of the display, the second map being a georeferenced map that displays at least a portion of an identical geographic region displayed in the raster map;

receiving ~~a finite sequence~~ of two or more point-pairs, each point-pair consisting of a point from the first map and a corresponding point from the second map, wherein the point-pairs are chosen such that corresponding points of each point-pair refer to the same geographic location; and

computing, with each additional point-pair received after the first point-pair, a georeferencing function for the first map that expresses a mathematical relationship between pixel coordinates ~~and geographic coordinates~~ of an arbitrary point on the first map and corresponding geographic coordinates on the second map.

26. (Currently Amended) The method of claim 25, wherein receiving ~~a finite sequence~~ of two or more point-pairs ceases once a quality of the computed georeferencing function is determined to be adequate.

27. (New) The method of claim 1, wherein the first map and the second map are displayed in the same scale.
